

CAM Planters – easy to say, even easier on the farm

Inlon has announced the rebranding of Checchi and Magli's world class seedling transplanter systems and plastic mulch layer machines. The Italian pronunciation can be a challenge for English-speaking folk, so the machines will now be branded with the company abbreviation CAM and what it is famous for, PLANTERS.

The company was founded 42 years ago by Messrs Checchi and Magli, and the transplanters have been popular on Australian farms for over 30 years starting with the famous TEX planter. The modern seedling planter system is a modular, flexible system for single row right through to wide 12 row configurations with different mechanisms to suit different plants and planting methods and the desired row and plant spacings.

As well as offering complete planting machines, CAM Planters offers an easy and cost effective way to upgrade existing planters (of any brand) to the latest technology. Simply un-bolt your old planter from the toolbar and bolt-in the CAM UNITRIUM Unit in its place.

Save money by keeping your current toolbar, wheels, shelves and shade. [SEP]

Jim Jardim, Inlon's Managing Director, talks about the new CAM Planters for planting through mulch. 'Plastic mulch machinery is a fast-growing segment with increasing enquiries and sales over recent years. As well as the CAM PLASTIC LAYER machine, we now have a CAM PLASTIC RETRIEVER machine, and a CAM SEED PLANTER for planting through plastic. With a 3-point linkage kit, it's possible to lay plastic and plant in one pass. Another growing segment is equipment for small scale organic potato and garlic growers, and CAM Planters has developed a range of machines for these growers.'
